

NAME

BN_generate_prime_ex2, BN_generate_prime_ex, BN_is_prime_ex, BN_check_prime, BN_is_prime_fasttest_ex, BN_GENCB_call, BN_GENCB_new, BN_GENCB_free, BN_GENCB_set_old, BN_GENCB_set, BN_GENCB_get_arg, BN_generate_prime, BN_is_prime, BN_is_prime_fasttest - generate primes and test for primality

SYNOPSIS

```
#include <openssl/bn.h>
```

```
int BN_generate_prime_ex2(BIGNUM *ret, int bits, int safe,
    const BIGNUM *add, const BIGNUM *rem, BN_GENCB *cb,
    BN_CTX *ctx);
```

```
int BN_generate_prime_ex(BIGNUM *ret, int bits, int safe, const BIGNUM *add,
    const BIGNUM *rem, BN_GENCB *cb);
```

```
int BN_check_prime(const BIGNUM *p, BN_CTX *ctx, BN_GENCB *cb);
```

```
int BN_GENCB_call(BN_GENCB *cb, int a, int b);
```

```
BN_GENCB *BN_GENCB_new(void);
```

```
void BN_GENCB_free(BN_GENCB *cb);
```

```
void BN_GENCB_set_old(BN_GENCB *gencb,
    void (*callback)(int, int, void *), void *cb_arg);
```

```
void BN_GENCB_set(BN_GENCB *gencb,
    int (*callback)(int, int, BN_GENCB *), void *cb_arg);
```

```
void *BN_GENCB_get_arg(BN_GENCB *cb);
```

The following functions have been deprecated since OpenSSL 0.9.8, and can be hidden entirely by defining **OPENSSL_API_COMPAT** with a suitable version value, see **openssl_user_macros(7)**:

```
BIGNUM *BN_generate_prime(BIGNUM *ret, int num, int safe, BIGNUM *add,
    BIGNUM *rem, void (*callback)(int, int, void *),
    void *cb_arg);
```

```
int BN_is_prime(const BIGNUM *p, int nchecks,
```

```
void (*callback)(int, int, void *), BN_CTX *ctx, void *cb_arg);
```

```
int BN_is_prime_fasttest(const BIGNUM *p, int nchecks,
    void (*callback)(int, int, void *), BN_CTX *ctx,
    void *cb_arg, int do_trial_division);
```

The following functions have been deprecated since OpenSSL 3.0, and can be hidden entirely by defining **OPENSSL_API_COMPAT** with a suitable version value, see **openssl_user_macros(7)**:

```
int BN_is_prime_ex(const BIGNUM *p, int nchecks, BN_CTX *ctx, BN_GENCB *cb);
```

```
int BN_is_prime_fasttest_ex(const BIGNUM *p, int nchecks, BN_CTX *ctx,
    int do_trial_division, BN_GENCB *cb);
```

DESCRIPTION

BN_generate_prime_ex2() generates a pseudo-random prime number of at least bit length **bits** using the BN_CTX provided in **ctx**. The value of **ctx** must not be NULL.

The returned number is probably prime with a negligible error. The maximum error rate is 2^{-128} . It's 2^{-287} for a 512 bit prime, 2^{-435} for a 1024 bit prime, 2^{-648} for a 2048 bit prime, and lower than 2^{-882} for primes larger than 2048 bit.

If **add** is **NULL** the returned prime number will have exact bit length **bits** with the top most two bits set.

If **ret** is not **NULL**, it will be used to store the number.

If **cb** is not **NULL**, it is used as follows:

- ⊕ **BN_GENCB_call(cb, 0, i)** is called after generating the i-th potential prime number.
- ⊕ While the number is being tested for primality, **BN_GENCB_call(cb, 1, j)** is called as described below.
- ⊕ When a prime has been found, **BN_GENCB_call(cb, 2, i)** is called.
- ⊕ The callers of **BN_generate_prime_ex()** may call **BN_GENCB_call(cb, i, j)** with other values as described in their respective man pages; see "SEE ALSO".

The prime may have to fulfill additional requirements for use in Diffie-Hellman key exchange:

If **add** is not **NULL**, the prime will fulfill the condition $p \% \mathbf{add} == \mathbf{rem}$ ($p \% \mathbf{add} == 1$ if **rem** == **NULL**) in order to suit a given generator.

If **safe** is true, it will be a safe prime (i.e. a prime p so that $(p-1)/2$ is also prime). If **safe** is true, and **rem** == **NULL** the condition will be $p \% \mathbf{add} == 3$. It is recommended that **add** is a multiple of 4.

The random generator must be seeded prior to calling **BN_generate_prime_ex()**. If the automatic seeding or reseeding of the OpenSSL CSPRNG fails due to external circumstances (see **RAND(7)**), the operation will fail. The random number generator configured for the **OSSL_LIB_CTX** associated with **ctx** will be used.

BN_generate_prime_ex() is the same as **BN_generate_prime_ex2()** except that no **ctx** parameter is passed. In this case the random number generator associated with the default **OSSL_LIB_CTX** will be used.

BN_check_prime(), **BN_is_prime_ex()**, **BN_is_prime_fasttest_ex()**, **BN_is_prime()** and **BN_is_prime_fasttest()** test if the number **p** is prime. The functions tests until one of the tests shows that **p** is composite, or all the tests passed. If **p** passes all these tests, it is considered a probable prime.

The test performed on **p** are trial division by a number of small primes and rounds of the of the Miller-Rabin probabilistic primality test.

The functions do at least 64 rounds of the Miller-Rabin test giving a maximum false positive rate of 2^{-128} . If the size of **p** is more than 2048 bits, they do at least 128 rounds giving a maximum false positive rate of 2^{-256} .

If **nchecks** is larger than the minimum above (64 or 128), **nchecks** rounds of the Miller-Rabin test will be done.

If **do_trial_division** set to **0**, the trial division will be skipped. **BN_is_prime_ex()** and **BN_is_prime()** always skip the trial division.

BN_is_prime_ex(), **BN_is_prime_fasttest_ex()**, **BN_is_prime()** and **BN_is_prime_fasttest()** are deprecated.

BN_is_prime_fasttest() and **BN_is_prime()** behave just like **BN_is_prime_fasttest_ex()** and **BN_is_prime_ex()** respectively, but with the old style call back.

ctx is a preallocated **BN_CTX** (to save the overhead of allocating and freeing the structure in a loop), or **NULL**.

If the trial division is done, and no divisors are found and **cb** is not **NULL**, **BN_GENCB_call(cb, 1, -1)** is called.

After each round of the Miller-Rabin probabilistic primality test, if **cb** is not **NULL**, **BN_GENCB_call(cb, 1, j)** is called with **j** the iteration ($j = 0, 1, \dots$).

BN_GENCB_call() calls the callback function held in the **BN_GENCB** structure and passes the ints **a** and **b** as arguments. There are two types of **BN_GENCB** structure that are supported: "new" style and "old" style. New programs should prefer the "new" style, whilst the "old" style is provided for backwards compatibility purposes.

A **BN_GENCB** structure should be created through a call to **BN_GENCB_new()**, and freed through a call to **BN_GENCB_free()**.

For "new" style callbacks a **BN_GENCB** structure should be initialised with a call to **BN_GENCB_set()**, where **gencb** is a **BN_GENCB ***, **callback** is of type **int (*callback)(int, int, BN_GENCB *)** and **cb_arg** is a **void ***. "Old" style callbacks are the same except they are initialised with a call to **BN_GENCB_set_old()** and **callback** is of type **void (*callback)(int, int, void *)**.

A callback is invoked through a call to **BN_GENCB_call**. This will check the type of the callback and will invoke **callback(a, b, gencb)** for new style callbacks or **callback(a, b, cb_arg)** for old style.

It is possible to obtain the argument associated with a **BN_GENCB** structure (set via a call to **BN_GENCB_set** or **BN_GENCB_set_old**) using **BN_GENCB_get_arg**.

BN_generate_prime() (deprecated) works in the same way as **BN_generate_prime_ex()** but expects an old-style callback function directly in the **callback** parameter, and an argument to pass to it in the **cb_arg**. **BN_is_prime()** and **BN_is_prime_fasttest()** can similarly be compared to **BN_is_prime_ex()** and **BN_is_prime_fasttest_ex()**, respectively.

RETURN VALUES

BN_generate_prime_ex() return 1 on success or 0 on error.

BN_is_prime_ex(), **BN_is_prime_fasttest_ex()**, **BN_is_prime()**, **BN_is_prime_fasttest()** and **BN_check_prime** return 0 if the number is composite, 1 if it is prime with an error probability of less than $0.25^{nchecks}$, and -1 on error.

BN_generate_prime() returns the prime number on success, **NULL** otherwise.

BN_GENCB_new returns a pointer to a **BN_GENCB** structure on success, or **NULL** otherwise.

BN_GENCB_get_arg returns the argument previously associated with a BN_GENCB structure.

Callback functions should return 1 on success or 0 on error.

The error codes can be obtained by **ERR_get_error(3)**.

REMOVED FUNCTIONALITY

As of OpenSSL 1.1.0 it is no longer possible to create a BN_GENCB structure directly, as in:

```
BN_GENCB callback;
```

Instead applications should create a BN_GENCB structure using BN_GENCB_new:

```
BN_GENCB *callback;  
callback = BN_GENCB_new();  
if (!callback)  
    /* error */  
...  
BN_GENCB_free(callback);
```

HISTORY

The **BN_is_prime_ex()** and **BN_is_prime_fasttest_ex()** functions were deprecated in OpenSSL 3.0.

The **BN_GENCB_new()**, **BN_GENCB_free()**, and **BN_GENCB_get_arg()** functions were added in OpenSSL 1.1.0.

BN_check_prime() was added in OpenSSL 3.0.
