

NAME

DSA_generate_parameters_ex, DSA_generate_parameters - generate DSA parameters

SYNOPSIS

```
#include <openssl/dsa.h>
```

The following functions have been deprecated since OpenSSL 3.0, and can be hidden entirely by defining **OPENSSL_API_COMPAT** with a suitable version value, see **openssl_user_macros(7)**:

```
int DSA_generate_parameters_ex(DSA *dsa, int bits,
                              const unsigned char *seed, int seed_len,
                              int *counter_ret, unsigned long *h_ret,
                              BN_GENCB *cb);
```

The following functions have been deprecated since OpenSSL 0.9.8, and can be hidden entirely by defining **OPENSSL_API_COMPAT** with a suitable version value, see **openssl_user_macros(7)**:

```
DSA *DSA_generate_parameters(int bits, unsigned char *seed, int seed_len,
                             int *counter_ret, unsigned long *h_ret,
                             void (*callback)(int, int, void *), void *cb_arg);
```

DESCRIPTION

All of the functions described on this page are deprecated. Applications should instead use **EVP_PKEY_paramgen_init(3)** and **EVP_PKEY_keygen(3)** as described in **EVP_PKEY-DSA(7)**.

DSA_generate_parameters_ex() generates primes *p* and *q* and a generator *g* for use in the DSA and stores the result in **dsa**.

bits is the length of the prime *p* to be generated. For lengths under 2048 bits, the length of *q* is 160 bits; for lengths greater than or equal to 2048 bits, the length of *q* is set to 256 bits.

If **seed** is NULL, the primes will be generated at random. If **seed_len** is less than the length of *q*, an error is returned.

DSA_generate_parameters_ex() places the iteration count in ***counter_ret** and a counter used for finding a generator in ***h_ret**, unless these are NULL.

A callback function may be used to provide feedback about the progress of the key generation. If **cb** is not NULL, it will be called as shown below. For information on the BN_GENCB structure and the BN_GENCB_call function discussed below, refer to **BN_generate_prime(3)**.

DSA_generate_prime() is similar to **DSA_generate_prime_ex()** but expects an old-style callback function; see **BN_generate_prime(3)** for information on the old-style callback.

- ⊕ When a candidate for q is generated, **BN_GENCB_call(cb, 0, m++)** is called (m is 0 for the first candidate).
- ⊕ When a candidate for q has passed a test by trial division, **BN_GENCB_call(cb, 1, -1)** is called. While a candidate for q is tested by Miller-Rabin primality tests, **BN_GENCB_call(cb, 1, i)** is called in the outer loop (once for each witness that confirms that the candidate may be prime); i is the loop counter (starting at 0).
- ⊕ When a prime q has been found, **BN_GENCB_call(cb, 2, 0)** and **BN_GENCB_call(cb, 3, 0)** are called.
- ⊕ Before a candidate for p (other than the first) is generated and tested, **BN_GENCB_call(cb, 0, counter)** is called.
- ⊕ When a candidate for p has passed the test by trial division, **BN_GENCB_call(cb, 1, -1)** is called. While it is tested by the Miller-Rabin primality test, **BN_GENCB_call(cb, 1, i)** is called in the outer loop (once for each witness that confirms that the candidate may be prime). i is the loop counter (starting at 0).
- ⊕ When p has been found, **BN_GENCB_call(cb, 2, 1)** is called.
- ⊕ When the generator has been found, **BN_GENCB_call(cb, 3, 1)** is called.

RETURN VALUES

DSA_generate_parameters_ex() returns a 1 on success, or 0 otherwise. The error codes can be obtained by **ERR_get_error(3)**.

DSA_generate_parameters() returns a pointer to the DSA structure or **NULL** if the parameter generation fails.

BUGS

Seed lengths greater than 20 are not supported.

SEE ALSO

DSA_new(3), **ERR_get_error(3)**, **RAND_bytes(3)**, **DSA_free(3)**, **BN_generate_prime(3)**

HISTORY

DSA_generate_parameters_ex() was deprecated in OpenSSL 3.0.

DSA_generate_parameters() was deprecated in OpenSSL 0.9.8; use **DSA_generate_parameters_ex()** instead.
