NAME

SPI_execute_plan_with_paramlist - execute a statement prepared by SPI_prepare

SYNOPSIS

```
int SPI_execute_plan_with_paramlist(SPIPlanPtr plan,
ParamListInfo params,
bool read_only,
long count)
```

DESCRIPTION

SPI_execute_plan_with_paramlist executes a statement prepared by **SPI_prepare**. This function is equivalent to **SPI_execute_plan** except that information about the parameter values to be passed to the query is presented differently. The ParamListInfo representation can be convenient for passing down values that are already available in that format. It also supports use of dynamic parameter sets via hook functions specified in ParamListInfo.

This function is now deprecated in favor of SPI_execute_plan_extended.

ARGUMENTS

```
SPIPlanPtr plan
prepared statement (returned by SPI_prepare)
```

ParamListInfo params

data structure containing parameter types and values; NULL if none

```
bool read_only true for read-only execution
```

long count

maximum number of rows to return, or 0 for no limit

RETURN VALUE

The return value is the same as for **SPI_execute_plan**.

SPI_processed and SPI_tuptable are set as in SPI_execute_plan if successful.
