## **NAME**

device\_enable, device\_disable, device\_is\_enabled - manipulate device enabled flag

#### **SYNOPSIS**

```
#include <sys/param.h>
#include <sys/bus.h>

void
device_enable(device_t dev);

void
device_disable(device_t dev);

int
device_is_enabled(device_t dev);
```

## **DESCRIPTION**

Each device has an enabled flag associated with it. A device is enabled by default when it is created but may be disabled (for instance to prevent a destructive or time consuming probe attempt). To disable a device, call **device\_disable()**, to re-enable it, call **device\_enable()** and to test to see if a device is enabled, call **device\_is\_enabled()**.

# **SEE ALSO**

device(9)
