

NAME

device_quiet, **device_verbose**, **device_is_quiet** - manipulate device quiet flag

SYNOPSIS

```
#include <sys/param.h>
```

```
#include <sys/bus.h>
```

void

```
device_quiet(device_t dev);
```

void

```
device_verbose(device_t dev);
```

int

```
device_is_quiet(device_t dev);
```

DESCRIPTION

Each device has a quiet flag associated with it. A device is verbose by default when it is created but may be quieted to prevent printing of the device identification string during attach and printing of a message during detach. To quiet a device, call **device_quiet()** during a device driver probe routine. To re-enable probe messages, call **device_verbose()**. To test to see if a device is quieted, call **device_is_quiet()**.

Devices are implicitly marked verbose after a driver detaches.
