

NAME

`glib-gettextize` - gettext internationalization utility

SYNOPSIS

`glib-gettextize` [OPTION...] [DIRECTORY]

DESCRIPTION

`glib-gettextize` helps to prepare a source package for being internationalized through gettext. It is a variant of the **`gettextize`** that ships with gettext.

`glib-gettextize` differs from **`gettextize`** in that it doesn't create an intl/ subdirectory and doesn't modify po/ChangeLog (note that newer versions of **`gettextize`** behave like this when called with the **`--no-changelog`** option).

OPTIONS**`--help`**

print help and exit

`--version`

print version information and exit

`-c, --copy`

copy files instead of making symlinks

`-f, --force`

force writing of new files even if old ones exist

SEE ALSO

`gettextize(1)`
