## **NAME**

glib-gettextize - gettext internationalization utility

#### **SYNOPSIS**

```
glib-gettextize [OPTION...] [DIRECTORY]
```

## **DESCRIPTION**

**glib-gettextize** helps to prepare a source package for being internationalized through gettext. It is a variant of the **gettextize** that ships with gettext.

**glib-gettextize** differs from **gettextize** in that it doesn't create an intl/ subdirectory and doesn't modify po/ChangeLog (note that newer versions of **gettextize** behave like this when called with the **--no-changelog** option).

## **OPTIONS**

## --help

print help and exit

#### --version

print version information and exit

## -c, --copy

copy files instead of making symlinks

# -f, --force

force writing of new files even if old ones exist

## **SEE ALSO**

gettextize(1)
