NAME

   gss_get_mic, **gss_sign** - Calculate a cryptographic message integrity code (MIC) for a message; integrity service

SYNOPSIS

   #include <gssapi/gssapi.h>

   OM_uint32
   gss_get_mic(*OM_uint32 *minor_status*, *const gss_ctx_id_t context_handle*, *gss_qop_t qop_req*,
      const gss_buffer_t message_buffer, *gss_buffer_t msg_token*);

   OM_uint32
   gss_sign(*OM_uint32 *minor_status*, *const gss_ctx_id_t context_handle*, *gss_qop_t qop_req*,
      gss_buffer_t message_buffer, *gss_buffer_t msg_token*);

DESCRIPTION

   Generates a cryptographic MIC for the supplied message, and places the MIC in a token for transfer to the peer application. The *qop_req* parameter allows a choice between several cryptographic algorithms, if supported by the chosen mechanism.

   Since some application-level protocols may wish to use tokens emitted by **gss_wrap**() to provide "secure framing", implementations must support derivation of MICs from zero-length messages.

   The **gss_sign**() routine is an obsolete variant of **gss_get_mic**(). It is provided for backwards compatibility with applications using the GSS-API V1 interface. A distinct entrypoint (as opposed to #define) is provided, both to allow GSS-API V1 applications to link and to retain the slight parameter type differences between the obsolete versions of this routine and its current form.

PARAMETERS

   minor_status   Mechanism specific status code.

   context_handle   Identifies the context on which the message will be sent.

   qop_req   Specifies requested quality of protection. Callers are encouraged, on portability grounds, to accept the default quality of protection offered by the chosen mechanism, which may be requested by specifying GSS_C_QOP_DEFAULT for this parameter. If an unsupported protection strength is requested, **gss_get_mic**() will return a *major_status* of GSS_S_BAD_QOP.

   message_buffer   Message to be protected.

msg_token   Buffer to receive token. The application must free storage associated with this buffer
                 after use with a call to **gss_release_buffer**().

RETURN VALUES

GSS_S_COMPLETE   Successful completion

GSS_S_CONTEXT_EXPIRED The context has already expired

GSS_S_NO_CONTEXT   The context_handle parameter did not identify a valid context

GSS_S_BAD_QOP   The specified QOP is not supported by the mechanism
