NAME

iconv - codeset conversion utility

SYNOPSIS

```
iconv [-cs] -f from_name -t to_name [file ...]
iconv -f from_name [-cs] [-t to_name] [file ...]
iconv -t to_name [-cs] [-f from_name] [file ...]
iconv -l
```

DESCRIPTION

The **iconv** utility converts the codeset of *file* (or from standard input if no file is specified) from codeset *from_name* to codeset *to_name* and outputs the converted text on standard output.

FreeBSD General Commands Manual

The following options are available:

- -c Prevent output of any invalid characters. By default, **iconv** outputs an "invalid character" specified by the *to_name* codeset when it encounts a character which is valid in the *from_name* codeset but does not have a corresponding character in the *to_name* codeset.
- **-f** Specifies the source codeset name as *from_name*.
- **-l** Lists available codeset names. Note that not all combinations of *from_name* and *to_name* are valid.
- -s Silent. By default, **iconv** outputs the number of "invalid characters" to standard error if they exist. This option prevents this behaviour.
- **-t** Specifies the destination codeset name as *to_name*.

EXIT STATUS

The **iconv** utility exits 0 on success, and >0 if an error occurs.

EXAMPLES

Convert file.txt from IBM273 to UTF-8 and save the result to converted.txt:

```
icony -f IBM273 -t UTF-8 file.txt > converted.txt
```

SEE ALSO

```
mkcsmapper(1), mkesdb(1), iconv(3)
```

STANDARDS

iconv conform to IEEE Std 1003.1-2008 ("POSIX.1").

HISTORY

iconv first appeared in NetBSD 2.0, and made its appearance in FreeBSD 9.0.
