

**NAME**

ippfind - find internet printing protocol printers

**SYNOPSIS**

**ippfind** [ *options* ] *regtype*[,*subtype*][*.domain*.] ... [ *expression*  
... ]

**ippfind** [ *options* ] *name*[.*regtype*[*.domain*.]] ... [ *expression*  
... ]

**ippfind --help**

**ippfind --version**

**DESCRIPTION**

**ippfind** finds services registered with a DNS server or available through local devices. Its primary purpose is to find IPP printers and show their URIs, show their current status, or run commands.

**REGISTRATION TYPES**

**ippfind** supports the following registration types:

`_http._tcp`

HyperText Transport Protocol (HTTP, RFC 2616)

`_https._tcp`

Secure HyperText Transport Protocol (HTTPS, RFC 2818)

`_ipp._tcp`

Internet Printing Protocol (IPP, RFC 2911)

`_ipps._tcp`

Secure Internet Printing Protocol (IPPS, draft)

`_printer._tcp`

Line Printer Daemon (LPD, RFC 1179)

**EXPRESSIONS**

**ippfind** supports expressions much like the **find**(1) utility. However, unlike **find**(1), **ippfind** uses POSIX regular expressions instead of shell filename matching patterns. If `--exec`, `-l`, `--ls`, `-p`, `--print`, `--print-name`, `-q`, `--quiet`, `-s`, or `-x` is not specified, **ippfind** adds `--print` to print the service URI of anything it finds. The following expressions are supported:

**-d** *regex*

**--domain** *regex*

True if the domain matches the given regular expression.

**--false**

Always false.

**-h** *regex***--host** *regex*

True if the hostname matches the given regular expression.

**-l**

**--ls** Lists attributes returned by Get-Printer-Attributes for IPP printers and traditional *find* "-ls" output for HTTP URLs. The result is true if the URI is accessible, false otherwise.

**--local**

True if the service is local to this computer.

**-N** *name***--literal-name** *name*

True if the service instance name matches the given name.

**-n** *regex***--name** *regex*

True if the service instance name matches the given regular expression.

**--path** *regex*

True if the URI resource path matches the given regular expression.

**-P** *number*[-*number*]**--port** *number*[-*number*]

True if the port matches the given number or range.

**-p****--print**

Prints the URI if the result of previous expressions is true. The result is always true.

**-q**

**--quiet**

Quiet mode - just returns the exit codes below.

**-r**

**--remote**

True if the service is not local to this computer.

**-s**

**--print-name**

Prints the service instance name if the result of previous expressions is true. The result is always true.

**--true** Always true.

**-t** *key*

**--txt** *key*

True if the TXT record contains the named key.

**--txt-key** *regex*

True if the TXT record contains the named key and matches the given regular expression.

**-u** *regex*

**--uri** *regex*

True if the URI matches the given regular expression.

**-x** *utility* [ *argument* ... ] ;

**--exec** *utility* [ *argument* ... ] ;

Executes the specified program if the current result is true. "{foo}" arguments are replaced with the corresponding value - see SUBSTITUTIONS below.

Expressions may also contain modifiers:

( *expression* )

Group the result of expressions.

! *expression*

--not *expression*

Unary NOT of the expression.

*expression expression*

*expression --and expression*

Logical AND of expressions.

*expression --or expression*

Logical OR of expressions.

## SUBSTITUTIONS

The substitutions for "{foo}" in *-e* and *--exec* are:

**{service\_domain}**

Domain name, e.g., "example.com.", "local.", etc.

**{service\_hostname}**

Fully-qualified domain name, e.g., "printer.example.com.", "printer.local.", etc.

**{service\_name}**

Service instance name, e.g., "My Fine Printer".

**{service\_port}**

Port number for server, typically 631 for IPP and 80 for HTTP.

**{service\_regtype}**

DNS-SD registration type, e.g., "\_ipp.\_tcp", "\_http.\_tcp", etc.

**{service\_scheme}**

URI scheme for DNS-SD registration type, e.g., "ipp", "http", etc.

{ }

**{service\_uri}**

URI for service, e.g., "ipp://printer.local/ipp/print", "http://printer.local/", etc.

**{txt\_key}**

Value of TXT record *key* (lowercase).

## OPTIONS

**ippfind** supports the following options:

### **--help**

Show program help.

### **--version**

Show program version.

**-4** Use IPv4 when listing.

**-6** Use IPv6 when listing.

### **-T seconds**

Specify find timeout in seconds. If 1 or less, **ippfind** stops as soon as it thinks it has found everything. The default timeout is 1 second.

### **-V version**

Specifies the IPP version when listing. Supported values are "1.1", "2.0", "2.1", and "2.2".

## EXIT STATUS

**ippfind** returns 0 if the result for all processed expressions is true, 1 if the result of any processed expression is false, 2 if browsing or any query or resolution failed, 3 if an undefined option or invalid expression was specified, and 4 if it ran out of memory.

## ENVIRONMENT

When executing a program, **ippfind** sets the following environment variables for the matching service registration:

### **IPPFIND\_SERVICE\_DOMAIN**

Domain name, e.g., "example.com.", "local.", etc.

### **IPPFIND\_SERVICE\_HOSTNAME**

Fully-qualified domain name, e.g., "printer.example.com.", "printer.local.", etc.

**IPPFIND\_SERVICE\_NAME**

Service instance name, e.g., "My Fine Printer".

**IPPFIND\_SERVICE\_PORT**

Port number for server, typically 631 for IPP and 80 for HTTP.

**IPPFIND\_SERVICE\_REGTYPE**

DNS-SD registration type, e.g., "\_ipp.\_tcp", "\_http.\_tcp", etc.

**IPPFIND\_SERVICE\_SCHEME**

URI scheme for DNS-SD registration type, e.g., "ipp", "http", etc.

**IPPFIND\_SERVICE\_URI**

URI for service, e.g., "ipp://printer.local/ipp/print", "http://printer.local/", etc.

**IPPFIND\_TXT\_KEY**

Values of TXT record *KEY* (uppercase).

**EXAMPLES**

To show the status of all registered IPP printers on your network, run:

```
ippfind --ls
```

Similarly, to send a PostScript test page to every PostScript printer, run:

```
ippfind --txt-pdl application/postscript --exec ipptool  
-f onepage-letter.ps '{ }' print-job.test \;
```
