NAME

Baobab - A graphical tool to analyse disk usage

SYNOPSIS

baobab [directory]

DESCRIPTION

baobab is able to scan either specific folders or the whole filesystem (local and remote), in order to give
the user a graphical tree representation including each directory size or percentage in the branch. It
also auto-detects in real-time any change made to your home directory as far as any
mounted/unmounted device. A graphical treemap window is also provided for any selected folder.

A detailed documentation on the program could be read at: http://www.mate.org/projects/baobab
