Name

    mysql_thread_init - initialize thread

Synopsis

    #include <mysql.h>

    my_bool mysql_thread_init(void);

Description

    Thread initialization for multi threaded clients. Multi threaded clients should call mysql_thread_init()
    at the beginning of the thread initialization to initialize thread specific client library variables. If
    mysql_thread_init() was not called explicitly, it will be called automatically by **mysql_init(3)** or
    mysql_real_connect(3).

Notes

    Before a client thread ends the **mysql_thread_end(3)** function must be called to release memory -
    otherwise the client library will report an error.

Return value

    Returns zero if successful or 1 if an error occurred.

History

    This function is deprecated since MariaDB Connector/C 3.0.0.
