

NAME

`ne_add_request_header`, `ne_print_request_header` - add headers to a request

SYNOPSIS

```
#include <ne_request.h>
```

```
void ne_add_request_header(ne_request *request, const char *name, const char *value);
```

```
void ne_print_request_header(ne_request *request, const char *name, const char *format, ...);
```

DESCRIPTION

The functions `ne_add_request_header` and `ne_print_request_header` can be used to add headers to a request, before it is sent.

`ne_add_request_header` simply adds a header of given *name*, with given *value*.

`ne_print_request_header` adds a header of given *name*, taking the value from the **printf**-like *format* string parameter and subsequent variable-length argument list.
