Name

pic2graph – convert a pic diagram into a cropped image

Synopsis

```
pic2graph [-unsafe] [-format output-format] [-eqn delimiters] [convert-argument ...]
pic2graph --help
pic2graph -v
pic2graph --version
```

Description

pic2graph reads a pic(1) program from the standard input and writes an image file, by default in Portable Network Graphics (PNG) format, to the standard output. It furthermore translates eqn(1) constructs, so it can be used for generating images of mathematical formulae.

The input PIC code should *not* be wrapped with the **.PS** and **.PE/.PF** macros that normally guard it within groff(1) documents.

Arguments not recognized by *pic2graph* are passed to the ImageMagick or GraphicsMagick program *convert*(1). By specifying these, you can give your image a border, set the image's pixel density, or perform other useful transformations.

The output image is clipped using *convert*'s **-trim** option to the smallest possible bounding box that contains all the black pixels.

Options

--help displays a usage message, while -v and --version show version information; all exit afterward.

-eqn delimiters

Use *delimiters* as the opening and closing characters that delimit *eqn* directives; the default is "\$\$". The option argument *delimiters* should be a two-character string, but an empty string ("") is accepted as a directive to disable *eqn* processing.

-format output-format

Write the image in *output-format*, which must be understood by *convert*; the default is PNG.

-unsafe

Run *groff* in *unsafe* mode, enabling the PIC command **sh** to execute arbitrary Unix shell commands. The *groff* default is to forbid this.

Environment

```
GROFF_TMPDIR
TMPDIR
TMP
```

TEMP These environment variables are searched in the given order to determine the directory where temporary files will be created. If none are set, /tmp is used.

Authors

pic2graph was written by Eric S. Raymond (esr@thyrsus.com), based on a recipe by W. Richard Stevens.
