NAME

triggers - trigger file format

DESCRIPTION

triggers are executed at the end of the transactions: installation, deinstallation or upgrade. They are only executed once even if they have been triggered multiple times.

are triggered by pattern matching during the transaction. triggers are files located in */usr/local/share/pkg/triggers* Those files are in UCL format and should use a *.ucl* extension.

The format is the following:

path   exact path to match: each time a package installs a file or directory exactly matching the **path** the trigger will be executed at the end of the transation .

path_glob   glob path to match: each time a package installs a file or directory which matches the glob pattern **pattern** the trigger will be executed at the end of the transation .

path_regexp   regexp path to match: each time a package installs a file or directory which matches the regexp pattern **pattern** the trigger will be executed at the end of the transation .

cleanup   Object which represent the script to execute in case the transaction results in removal of the trigger from the installation. The object requires the following fields:

     type   The type of the script to be executed, currently only lua script is supported (See pkg-lua-script(5)).

     script   The script itself.

trigger   Object which represent the script to execute at the end of the transaction if a pattern has been matched. This object requires the following fields:

     type   The type of the script to be executed, currently only lua script is supported (See pkg-lua-script(5)).

     script   The script itself. It will receive as arguments the list of paths that matched the patterns during the transaction.
