NAME
poudriere-status - Show status of current and previous builds.

SYNOPSIS
poudriere [*poudriere-options*] **status** [*options*]

DESCRIPTION
This command shows status of current and previous builds. The **status** command sorts by SETNAME, PORTSTREE, JAILNAME and then BUILDNAME.

OPTIONS
-a   Show all builds, not just latest. This implies **-f**.

-b   Show details about what each builder for the matched builds are doing.

-B *name*   Specifies which buildname to match on. This supports shell globbing. Defaults to "latest". Specifying this implies the **-f** flag.

-c   Show a more compact output and do not include some columns.

-f   Show finished builds, not just currently running. This is implied by the **-a**, **-B** and **-r** flags.

-H   Do not print headers and separate fields by a single tab instead of arbitrary white space.

-j *name*   Specifies the *name* of the jail to filter by.

-l   Show logs instead of URL.

-p *tree*   This flag specifies which ports *tree* to filter builds by.

-r   Show build results. This implies the **-f** flag.

-z *set*   This specifies which SET to filter builds by. Use **0** to match on empty SET.
