NAME
tanpi, **tanpif**, **tanpil** - half-cycle tangent functions

LIBRARY
Math Library (libm, -lm)

SYNOPSIS
#include <math.h>

double
tanpi(*double x*);

float
tanpif(*float x*);

long double
tanpil(*long double x*);

DESCRIPTION
The **tanpi**(), **tanpif**(), and **tanpil**() functions compute the tangent of *<pi> x x* and measure angles in half-cycles.

RETURN VALUES
The **tanpi**(), **tanpif**(), and **tanpil**() functions returns **tan**(*<pi> x x*). If $|x| \geq 2^{(p-1)}$ where p is the floating-point precision of *x*, then the returned value is +-0 and it has no significance.

SPECIAL VALUES
tanpi(*+-0*) returns +-0.

tanpi(*+-n*) returns +-0 for positive integers *n*.

tanpi(*+-n/2*) returns NaN for n > 0 and raises an FE_INVALID exception.

tanpi(*+-<infinity>*) return an NaN and raises an FE_INVALID exception.

tanpi(*NaN*) return an NaN and raises an FE_INVALID exception.

SEE ALSO

AUTHORS

The half-cycle trignometric functions were written by Steven G. Kargl *<kargl@FreeBSD.org>*.

STANDARDS

These functions conform to IEEE Std 754tm-2008 , "IEEE Standard for Floating-Point Arithmetic" and to ISO/IEC TS 18661-4 , "Information technology -- Programming languages, their environments, and system software interfaces -- Floating-point extensions for C" -- Part 4: Supplementary functions.
