

NAME

zfsbootcfg - specify zfsboot options for the next boot

SYNOPSIS

```
zfsbootcfg <options>
zfsbootcfg [-n name] [-k key] [-p] [-t type] [-v value] [-z pool]
zfsbootcfg
```

DESCRIPTION

zfsbootcfg is used to set boot.config(5)-style options to be used by zfsboot(8), gptzfsboot(8) or loader(8) the next time the machine is booted. Once zfsboot(8) or gptzfsboot(8) or loader(8) reads the information, it is deleted. If booting fails, the machine automatically reverts to the previous boot configuration. The information is stored in a special boot environment area of a ZFS pool.

If used without arguments, **zfsbootcfg** will output the current boot configuration, if set.

The following options are supported by **zfsbootcfg**:

-k *key*

Define key for <key, value> pair.

-n *name*

Update nvlist *name*.

-p Print all information stored in ZFS pool bootenv area.

-t *type*

Set type of *value* used in <key, value> pair. Currently supported types are:

DATA_TYPE_BYTE

DATA_TYPE_INT8

DATA_TYPE_UINT8

DATA_TYPE_INT16

DATA_TYPE_UINT16

DATA_TYPE_INT32

DATA_TYPE_UINT32

DATA_TYPE_INT64

DATA_TYPE_UINT64

DATA_TYPE_BOOLEAN_VALUE

DATA_TYPE_STRING

If not specified, the default is *DATA_TYPE_STRING*.

-v value

Define value for <key, value> pair.

-z pool

Operate on *pool*.

ENVIRONMENT

`vfs.root.mountfrom` The kenv(1) variable that identifies a pool for which the options are written.

EXAMPLES

Try to boot to a new *boot environment* without changing the **bootfs** property of a pool:

```
zfsbootcfg "zfs:tank/ROOT/newbe:"
```

To clear the boot options:

```
zfsbootcfg ""
```
